

ABOUT US

Kommando is an IT security company that was established in summer 2017 and specializes in Identity Security. We help businesses and organizations in the Nordics secure their access and identities from digital threats. Our skilled local resources possess a good understanding and have extensive experience from helping customers with complex IT environments to realize their ambitions related to Identity Security. We can help your organization with feasibility studies, architecture and solution design, consultancy, and implementation of solutions related to securing your human and non-human identities.

SOLUTIONS

Privilege Access Management (PAM)

We secure your privileged accesses for both non-human and human identities. In collaboration with our strategic partner CyberArk, we help our customers with e.g.:

- Ensuring that the right person or machine gets access to specific target systems, at the right time, with only the necessary rights needed to perform tasks with full control and traceability
- Gain control over vulnerabilities tied to:
 - × Pass-the-hash
 - × Password management
 - × Shared user accounts
- Monitor mission-critical systems with the possibility of session recording for security and compliance purposes
- Implement Just-in-Time access with passwordless authentication

Identity & Access Management (IAM)

Kommando assists with IT security advisors, project managers and IAM architects. Together with our strategic partner SailPoint, we help customers (among other things):

- Manage 'joiners, movers, leavers' with necessary access at the right time, without overloading IT support
- Centralize control over all user access across on-premise, hybrid and Cloud environments
- Automate the discovery and management of roles, with data-driven insights for better and faster access decisions
- Approve, modify or deny access to the right users, at the right time
- Identify risky/anomalous accesses
- Ensure compliance with authority requirements in connection with identity and access management

Information Security

We have skilled information security advisors and project managers with local experience, in-depth understanding and competence who can help your organization in the work for compliance with various government requirements (GDPR, ISO27001, PCI-DSS, NIST2, etc.)

Active Directory Security (AD security)

We deliver solutions from Semperis that protect the AD environment from cyber attacks, and provide the ability to recover your AD environment in a short time, taking into account a constantly changing risk model for AD recovery. Get assistance for:

- Comprehensive security of hybrid AD environments
 - Stop attackers from gaining access to AD and Azure AD
 - Detects changes in both AD and Azure AD that have successfully bypassed security logs
 - Automatically remediate malicious changes in AD
- When your AD environment is compromised
 - Automate the entire forest recovery process, avoid human errors and cut downtime by up to 90%
 - Eliminate the risk of malware re-infection
 - Restoration to alternative hardware - virtual or physical - on premise or in the Cloud

Least Privilege Management

Kommando works closely with CyberArk to deliver a distributed solution that enables granular access control directly on endpoints; both clients and servers. This is an area that is often overlooked in solutions for endpoint security, but which can provide significant security gains for the vast majority of organisations.
